

The chart displays two data series over a five-year period from 2026 to 2030. The 'Actual prices' series (black line) shows significant fluctuations, with values ranging from approximately 4710 to 5310. The 'Predicted prices (validation)' series (blue line) follows a similar pattern but tends to be smoother and often overestimates the peak values while underestimating the trough values. For example, in early 2026, the actual price drops to around 4750, while the predicted price remains above 5000. By 2030, the actual price reaches a low of about 4850, whereas the predicted price is still above 5000.
